incl. 8,1% VAT incl. Shipping

Delivery **Mon 09. Nov - Tue 10. Nov 2026**

Sprenger articulated stirrups have a footplate that moves forward and backward, automatically positioning the rider's heel in the desired, deep position. In the event of a fall, the rider can dismount from these stirrups
much more easily than from standard stirrups. The joint allows the footplate to adapt to the rider’s natural, springy foot movement, ensuring constant contact with the sole of the foot. The result is a secure hold and relaxed calves, which is why the System 4 stirrup is extremely popular among show jumping and eventing riders. It is also increasingly used by dressage riders. The hips, knees, and ankles are relieved of strain while riding, which helps protect ligaments and menisci in particular. To this day, the “System 4 Articulated Stirrup” remains the epitome of comfortable and secure riding. It enjoys the utmost trust among riders ranging from recreational riders to professionals and can be found at every competition.
As is often the case, success inevitably attracts imitators. Counterfeit products from other manufacturers on the market are often of inferior quality and pose a significant safety risk.
Therefore, trust only the original from SPRENGER.

Product information

Due to the rubber side panels, the stirrup width is slightly narrower.
Stirrup width: 120 mm
